Get to create an oasis of relaxation where you can chill out in the fresh air amidst nature. Create your own dream space by using our terrace tiles.

koraTER® terrace tiles offer almost unlimited design options. They are easy to keep clean. Their durability and robustness mean that you will enjoy your beautifully arranged space for many years to come.

They are perfect for home, flat, garden, business, office and park applications. These can be applied anywhere you want to create a perfect relaxation spot.

Terraces, balconies, gardens and driveways make up an integral part of our homes. When selecting patio slabs, ensure that they match the style and colour of the building's façade. Should you happen to have a modern property, you can opt for distinctive colours with a natural stone pattern. A traditional or rustic house will look great against a wooden pattern.

Explore the koraTER® terrace tile collections.

STYLISTICS

ORGANIC REFINEMENT TILES IMITATING STONE

Stone patterns stand for a compromise between nature and modernity. Imitation of structures that can be found in nature guarantees the unique nature of an arrangement.

RAW MODERNITY TILES FEATURING A CONCRETE TEXTURE

A concrete texture perfectly defines the modern style. It represents a perfect choice for those who are minimalists. Its subtle colouring is suitable for highlighting plants and expressive accessories.

CLOSE TO NATURE WOOD-PATTERNED TILES

Warm colours and clearly defined grain provide a gentle atmosphere conducive to relaxation. The wooden pattern offers an excellent foundation for a cosy, timeless design.

INSTALLATIONS

One great advantage of koraTER® tiles is flexibility in the way they are installed. This allows to focus solely on aesthetic qualities of individual collections during purchase. The place and the substrate on which the panels will be fixed are not limited in any way.

INSTALLATION ON GRASS

- 1/ Grass
- 2/ koraTER® terrace clinker tile
- 3/ Compacted ballast 5-8 cm
- 4/ Soil

- Laying the terrace clinker tiles properly and stably on grass is relatively easy and can be successfully done independently. First of all, the grass has to be carefully cut and the soil has to be selected to a depth of approx. 5-8 cm. Then the space is filled with a 3/6 mm aggregate. It is important to consider the thickness of the clinker tile when compacting the base. It should not protrude above the level of the cut grass in order not to hinder lawn care.
- The advantage of this solution is that the clinker tiles can be laid anywhere, and it is easy to adjust their position or level.

APPLICATION GARDEN, SQUARE

INSTALLATION ON TERRACE SUPPORTS

Installation of terrace tiles on non-adjustable supports

- When deciding to install terrace tiles on supports, care must be taken to ensure a suitable sub-floor. It should have a slope and be waterproofed. The chosen supports – fixed or adjustable. The supports should be laid according to the design made strictly in accordance with the manufacturer's recommendations.
- The supports are equipped with special-purpose distance strips to ensure that an equal distance is maintained between the tiles. The gaps provide drainage so that water does not accumulate on the terrace.
- Free space between the substrate and the tiles can be used, for example, for installing a watering system for plants. An additional advantage is that the look of the terrace can be modified at any time, as the components are not permanently connected to each other.

APPLICATION TERRACES, BALCONIES

Installation of terrace tiles on adjustable supports

- 1/ koraTER® terrace clinker tile
- 2/ System footings
- 3/ Waterproof insulation
- 4/ Concrete foundation and slope

- 1/ koraTER® terrace clinker tile
- 2/ Clinker tile adhesive
- 3/ Concrete drainage
- 4/ Compacted gravel
- 5/ Soil

INSTALLATION ON DRAINAGE MORTAR

- In areas subject to increased loads, the clinker tiles can be installed by means of adhesive. The substrate requires several layers to be prepared to ensure the stability and strength of the usable surface. The bottom layer, laid directly on the ground, is a compacted gravel over which concrete is poured. The drainage concrete layer should be 8 to 10 centimetres thick. The clinker tiles are installed using adhesive to the base course.
- Bonded clinker tiles can be tightly grouted. To ensure effective drainage, the surface should include a slope of 1.5 - 2%.
- In case of large usable surfaces, expansion gaps should be planned, dividing the entire area into sectors not exceeding 16 m².
- Adhesive-on installation minimises the risk of the clinker tiles shifting.

APPLICATION DRIVEWAYS, GARAGES, INDUSTRIAL FACILITIES

INSTALLATION ON SAND

- 1/ koraTER® terrace clinker tile
- 2/ Permeable aggregate layers of decreasing fraction
- 3/ Non-woven fabric against overgrowth
- 4/ Soil

- In areas where increased load-bearing capacity is not required, the terrace clinker tiles can be installed on sand or gravel bedding.
- In order to prevent overgrowth of plants, a non-woven fabric is laid directly onto the ground as the first layer of substrate. Then, to ensure effective drainage, aggregates of decreasing fraction are used sequentially, where a layer of sand or 3/6 mm aggregate should be placed directly under the clinker tiles.
- In this type of installation, the joints are not filled in order to ensure the free flow of water. If it is important to prevent the tiles from moving sideways, they can be fixed in two ways: by applying a contact layer of adhesive mortar underneath or using special-purpose spacers.

APPLICATION TERRACE, GARDEN

TECHNICAL SPECIFICATIONS

In addition to their striking design, koraTER® clinker tiles are distinguished by their durability and a range of functional properties. They are resistant to external influences, including salt used in the winter season to thaw slippery surfaces. They are made of fully frost-resistant ceramic material. The surface structure of all koraTER® terrace clinker tiles is non-slip.
